Brief portfolio Melanie SERRALHEIRO

HOME :

The first rectangle below the navigation bar is a phrase slider that appears and disappears as if typed on a keyboard. In the big rectangle below it is info on me in this rectangle there is 3 numbered square in the first there will be a computer image with a picture of me in the background and under this square there will be General info about me code and games in the second square this will always be a computer picture but this time with a background of video games and below the info on me and the video games and in the last square still a computer But with a line of code wallpaper and below info about me and the code. In the third rectangle there are two graphics the first represents my level in 8 html / css category, PHP, jQuery, Ajax, SQL, boostrape, Photoshop, and my ability to indent my code, and in the second graphic what I Do most of the time so code, geeker, sleep, eat, techno watch, and other ... When the bottom of the large rectangle sits visible my level of the first graph will stretch and this will stop at the level at which I am in each category and the second graph will have the bars that will rise and when the two graphs halt the names of each category will appear at Above each point, and if one touches a precise part of each graph the animation will restart for the part select. The fourth rectangle represents two map one of the earth with France in red and one can make it turn according to where one rests on the rectangle which contains it and the other the map of France with the Franche-Comté in red and if On zoom Besançon will turn red. And all the way down two button one to see my cv and the other to go up to the top with a good effect.

PORTFOLIO :

Just below the navigation bar there is a search bar to be able to see what I have done such a month of such year with everything right a message that would say its done so much time that I started with the number Of months which would change according to the research that one would make, by default its squeezed the month in court that would be displayed. Below all the projects will show in book form with the title on it and an image that represents the project if one selects a project a rectangle opens and the other projects pass under the rectangle which knows opened one would see the title the language Use and a small description of the project. And all the way down again the possibility to see my cv or to go up with the button and its effect of jump.

CONTACT :

Basic form with possibility to zoom but when you press on send there is a effect of page that flies by the top of the smartphone. And if you press the button to go up x times in a row the smartphone vibrates and screen this crack as it does not tighten to anything to go up if one is already up.

LINK :

When one touches a link the writing comes out of the screen by the right quickly and makes it vibrate.

In any case if one touches the CV the screen moves and the phone vibrates smoothly as steps of something enormous. And the resume will fall on the screen like a big stone block and vibrate the smartphone.

I will use 'vue js' because:

- It can store and store portfolio data for example, without making any changes in the model.
- The view is interactive, so the actions of the user can trigger animations.
- It records every step so there is the ability to go back easily.
- It allows the setting up of a chrono which is useful for my project.
